. You know you need the latest version of a software program, but it's not available on your computer because you're using an earlier version of Windows or Internet Explorer. To accomplish this, you will have to download a virtualized application. One such tool is Microsoft Virtual PC 2007, which lets you run different operating systems in a separate window while running Windows itself in another window. For most users, this means they can switch between operating systems without having to log off and on repeatedly. This makes it ideal for troubleshooting problems with your computer's software programs and hardware components while maintaining the rest of their work environment unfettered by interruptions or downtime mandates for system changes or repairs. There are a number of other ways to do this, but none of them give you the ease and access you get with a virtual machine. In this article, you'll learn how to create a virtual machine using Virtual PC 2007.

In order to start creating your very own virtual machine, follow these steps: Step 1: You will need to install Virtual PC from here

Step 2: While installing Virtual PC 2007, choose the options that apply the functionality you will be adding to your current operating system

Step 3: Once installation is complete, go to Control Panel > System and Security > System. Here you will be able to create or edit your new virtual machine.

Step 4: From this screen, select 'Add or remove a Virtual Machine'

Step 5: Now in the dropdown menu, select Create New Virtual Machine

Step 6: Now you will need to supply your Virtual PC 2007 installation DVD in order to get started. This is simply a copy of the DVD that came with all of your system software. It is absolutely free and requires no shipping charges. If you get this, then skip to Step 7. If you do not have the installation DVD, you will need to purchase it from Microsoft for $69.95.

Step 7: Now to begin your virtual machine creation, press Enter

Step 8: From here, you will need to choose which version of Windows you are using. Click on the version of Windows that is appropriate for your current needs on your computer. Click Next

Step 9: Now on this screen, select whether or not you want this virtual machine to be able to use a USB device attached to the computer

Step 10: Here you can choose how much hard drive space is dedicated to the virtual machine itself. Click Next once you have made your selection

Step 11: Now you will need to select which hard drive to use for the virtual machine. Click on the drives that are appropriate for your needs

Step 12: You can now name your virtual machine. Make sure to keep it short. Click Next when you are ready

Step 13: Now the system will begin creating your virtual machine, which can take up to an hour or more.
